

Linking Assets

Managing company equipment and assets just got easier!

3 Key Features

Assign company assets to any location, user, or other asset.

Sign assets in and out by scanning QR codes.

View and re-assign linked assets in any user profile or location.

The asset linking feature lets you see who signed out assets,

where they're being used, and if they're attached to another asset. For example, you can have a fire extinguisher, GPS device, toolbox, and an AED assigned to a company truck. You can then assign that truck to a company supervisor who is responsible for it all. This technology allows you to view all the assets assigned to any employee, worksite, or another asset with the click of a button.

Streamline Asset Management

The linked asset technology can drastically reduce the time your team spends managing company equipment and assets. You can quickly see who has what equipment, where it is, and when it's time for an inspection or maintenance.

► Instant Access to Asset Profiles

Our asset management system can create QR codes for all your equipment. Scan the QR codes and instantly assign equipment to a person, location, or any other equipment.

► Move Assets with Ease

You can instantly re-assign any assets or equipment to other worksites and workers or attach them to another asset without disrupting your scheduled forms.

For example, a daily scheduled pre-trip inspection form for a forklift will continue to automatically send no matter the location the forklift is assigned. Re-assign equipment safely without work delays!

► Unlimited Asset Assignments

Assign as many assets as you need to people, locations, and other assets!

With the asset linking technology, you can assign equipment to a toolbox, attach that toolbox and other equipment to a company vehicle, which can be assigned to a worksite or user, and then see it all at-a-glance with the asset assignment tree in every asset, location, or user profile.

If your team finds equipment in the wrong worksite, they can look it up and find out where it's needed with just a quick scan. Keep your worksites running at a world-class level!
